As of 9/04/2016 06:00 EDT, water levels continue to be elevated along the Mid-Atlantic coast due to Hermine. At this time, the highest residual water levels are observed in southern Chesapeake Bay, including the Hampton Roads area where water levels remain 1.8 to 2.3 feet above normal tide levels. Along the Atlantic Seaboard from USCG Hatteras, NC to Atlantic City, NJ, water levels range from 1.3 to 2.3 feet above tidal predictions. Water levels from Sandy Hook, NJ to Montauk, NY including the New York City area are slightly elevated by less than 1 foot above
normal tide levels.

While winds have decreased as Hermine has moved farther off the coast, the highest winds are still observed along the coast from USCG Hatteras, NC to Lewes, DE and range from 10 to 20 knots with gusts to 30 knots. Barometric pressure is fairly steady this evening along the Mid-Atlantic coastline as the storm center is now well offshore.

Water Level and Meteorological plots available below are updated automatically. A line denoting Mean Higher High Water (MHHW) is displayed to provide an approximate indication of when flooding inundation may occur.

For additional data, please see the Center for Operational Oceanographic Products & Services website. For more information or archived products and reports, please see the Storm QuickLook Homepage.

SELECT NATIONAL HURRICANE CENTER ADVISORY INFORMATION:

POST-TROPICAL CYCLONE HERMINE ADVISORY NUMBER 28
NWS NATIONAL HURRICANE CENTER MIAMI FL
500 AM EDT SUN SEP 04 2016

...HERMINE EXPECTED TO SLOW DOWN AND TURN NORTHWARD LATER TODAY...
...DANGEROUS STORM SURGE TO CONTINUE ALONG THE COAST FROM VIRGINIA TO NEW JERSEY...

SUMMARY OF 500 AM EDT...0900 UTC...INFORMATION
---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------
LOCATION...36.8N 70.8W
ABOUT 305 MI...485 KM SSE OF THE EASTERN TIP OF LONG ISLAND
ABOUT 255 MI...415 KM ESE OF OCEAN CITY MARYLAND
MAXIMUM SUSTAINED WINDS...65 MPH...100 KM/H
PRESENT MOVEMENT...ENE OR 65 DEGREES AT 12 MPH...19 KM/H
MINIMUM CENTRAL PRESSURE...998 MB...29.47 INCHES

WATCHES AND WARNINGS
---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------
CHANGES WITH THIS ADVISORY:

The Tropical Storm Warning has been discontinued south of Duck, North Carolina.

SUMMARY OF WATCHES AND WARNINGS IN EFFECT:

A Tropical Storm Warning is in effect for...
* Duck to west of Watch Hill
* Chesapeake Bay from Smith Point southward
* Delaware Bay

A Tropical Storm Watch is in effect for...
* Watch Hill to Sagamore Beach
* Block Island
DISCUSSION AND 48-HOUR OUTLOOK

At 500 AM EDT (0900 UTC), the center of Post-Tropical Cyclone Hermine was located near latitude 36.8 North, longitude 70.8 West. The post-tropical cyclone is moving toward the east-northeast near 12 mph (19 km/h). A turn toward the northeast and the north with a decrease in forward speed is expected later today, followed by a slow northward to northwestward motion through Monday. On the forecast track, the center of Hermine will meander slowly offshore of the mid-Atlantic coast for the next couple of days.

Maximum sustained winds are near 65 mph (100 km/h) with higher gusts. Little change in strength is expected today. After that, the cyclone is forecast to intensify to hurricane force late tonight and on Monday.

Hermine has a large wind field. Tropical-storm-force winds extend outward up to 205 miles (335 km) from the center.

The minimum central pressure based on recent reports from an Air Force Reserve reconnaissance aircraft is 998 mb (29.47 inches).

HAZARDS AFFECTING LAND

WIND: Tropical storm conditions will continue to spread northward within the warning area along the Atlantic coast through Monday, and there may be multiple occurrences of tropical storm conditions along portions of the mid-Atlantic coast in the warning area during the next couple of days. Tropical storm conditions are possible in the watch area by Monday.

STORM SURGE: The combination of a storm surge and the tide will cause normally dry areas near the coast to be flooded by rising waters moving inland from the shoreline. Along the immediate coastline, the surge will be accompanied by large and dangerous waves. There is a danger of life-threatening inundation through tonight in the Hampton Roads area, and in the next 36 hours from Chincoteague, Virginia, to Sandy Hook, New Jersey. Persons within these areas should take all necessary actions to protect life and property from rising water. Promptly follow all instructions, including evacuation orders, from local officials. There is also the possibility of life-threatening inundation during the next 48 hours at many coastal locations between Sandy Hook, New Jersey, and Bridgeport, Connecticut.

For a depiction of areas at risk, please see the Prototype Storm Surge Watch/Warning graphic, which displays areas that would qualify for inclusion under a storm surge watch or warning currently under development by the National Weather Service and planned for operational use in 2017. The Prototype Graphic is available at www.hurricanes.gov/graphics_at4.shtml?wsurge

The water could reach the following heights above ground if the peak surge occurs at the time of high tide...

North Carolina sounds...1 to 3 feet
Hampton Roads area...2 to 4 feet
Chincoteague, VA to Sandy Hook, NJ...3 to 5 feet
Sandy Hook, NJ to Bridgeport, CT...2 to 4 feet
RAINFALL: Heavy rainfall associated with Hermine will remain offshore through Monday/Labor Day. Hermine will produce rainfall amounts of 1 to 2 inches over southern New England from Long Island to eastern Massachusetts, and additional rainfall of one inch or less along the coastline of the mid-Atlantic states.

SURF: Large waves generated by Hermine will affect the U.S. east coast from the mid-Atlantic states and expand northward along the coast of southern New England through Monday. These waves are likely to cause life-threatening surf and rip current conditions, and significant beach erosion. Please consult products from your local weather office.

NEXT ADVISORY
