

Tropical Storm HARVEY QuickLook
 Posted: 17:00 CDT 08/30/2017

NOAA and NOAA Partnership Stations Relative to the Storm

Storm Analysis

As of 8/30/2017 17:00 CDT, water levels within upper Galveston Bay and the Galveston Intracoastal Waterway remain elevated due to rainfall runoff. The highest water levels continue to be observed at Manchester, TX, which is now measuring about 6 feet above normal tide levels. High Island, TX, within the ICW, is measuring over 4.5 feet above tidal predictions.

Water levels to the east of landfall at Freshwater Canal Locks, LA and Eugene Island, LA range between 0.75 and 1.5 feet above normal tide levels. Elsewhere along the Texas and western Louisiana coast, water levels at some stations range between 1 and 3 feet above predictions, though many are showing a return to normal water levels.

Winds from Galveston Bay Entrance, TX to Eugene Island, LA are measuring between 20 and 30 knots with gusts of 30 to 40 knots. Elsewhere, wind speeds generally range from 10 to 20 knots with slightly higher gusts.

Water levels in bays and associated waterways may include impacts from hydrological forces, including rainfall runoff. For additional hydrological information see the [NWS Advanced Hydrologic Prediction Services](#) or your local [National Weather Service Forecast Office](#).

Water Level and Meteorological plots available below are updated automatically. A line denoting [Mean Higher High Water](#) (MHHW) is displayed to provide an approximate indication of when flooding inundation may occur.

For additional data, please see the [Center for Operational Oceanographic Products & Services](#) website. For more information or archived products and reports, please see the [Storm QuickLook](#) Homepage.

SELECT [NATIONAL HURRICANE CENTER](#) ADVISORY INFORMATION:

Tropical Storm Harvey Advisory Number 42

NWS National Hurricane Center Miami FL

400 PM CDT Wed Aug 30 2017

...HARVEY STILL PRODUCING TROPICAL-STORM-FORCE WINDS NEAR THE LOUISIANA COAST...

...FLOODING RAINS CONTINUING OVER EXTREME EASTERN TEXAS AND WESTERN LOUISIANA...

SUMMARY OF 400 PM CDT...2100 UTC...INFORMATION

LOCATION...30.8N 93.1W

ABOUT 50 MI...80 KM N OF LAKE CHARLES LOUISIANA

ABOUT 50 MI...80 KM SW OF ALEXANDRIA LOUISIANA

MAXIMUM SUSTAINED WINDS...40 MPH...65 KM/H

PRESENT MOVEMENT...NNE OR 20 DEGREES AT 8 MPH...13 KM/H

MINIMUM CENTRAL PRESSURE...998 MB...29.47 INCHES

WATCHES AND WARNINGS

CHANGES WITH THIS ADVISORY:

The Storm Surge Watch and Warning are discontinued for the coasts of Texas and Louisiana.

SUMMARY OF WATCHES AND WARNINGS IN EFFECT:

A Tropical Storm Warning is in effect for...

* Sabine Pass Texas to Grand Isle Louisiana

Catastrophic and life-threatening flooding continues in southeastern Texas and portions of southwestern Louisiana. Please see warnings and other products issued by your local National Weather Service office for additional information on this life-threatening situation.

For storm information specific to your area, including possible inland watches and warnings, please monitor products issued by your local National Weather Service forecast office.

DISCUSSION AND 48-HOUR OUTLOOK

At 400 PM CDT (2100 UTC), the center of Tropical Storm Harvey was located near latitude 30.8 North, longitude 93.1 West. Harvey is moving erratically toward the north-northeast near 8 mph (13 km/h) and this motion is expected to continue tonight. A turn toward the northeast is expected Thursday or Thursday night. On the forecast track, the center of Harvey should move through southwestern and central Louisiana tonight, then move through northeastern Louisiana and northwestern Mississippi Thursday and Thursday night.

Maximum sustained winds are near 40 mph (65 km/h) with higher gusts. Weakening is forecast during the next 48 hours as Harvey moves farther inland, and the cyclone is expected to weaken to a tropical depression tonight.

Tropical-storm-force winds extend outward up to 140 miles (220 km) mainly over water to the southeast of the center. An automated station near Lacassine, Louisiana recently reported a wind gust of 44 mph (71 km/h).

The estimated minimum central pressure based on surface observations is 998 mb (29.47 inches).

HAZARDS AFFECTING LAND

RAINFALL: Harvey is expected to produce additional rainfall accumulations of 4 to 8 inches from southwestern Louisiana and the adjacent border of eastern Texas northeastward into western Tennessee and Kentucky through Friday with isolated amounts up to 12 inches. The threat of heavy rains has ended in the Houston/Galveston area. However catastrophic and life threatening flooding will continue in and around Houston, Beaumont/Port Arthur, eastward into southwest Louisiana for the rest of the week. The expected heavy rains spreading northeastward from Louisiana into western Kentucky may also lead to flash flooding and increased river and small stream flooding. **DO NOT ATTEMPT TO TRAVEL IN THE AFFECTED AREA IF YOU ARE IN A SAFE PLACE. DO NOT DRIVE INTO FLOODED ROADWAYS.** Please see warnings and products issued by your local National Weather Service office for additional information on this life-threatening situation.

Elsewhere, the outer bands of Harvey are expected to produce additional rainfall amounts of 3 to 6 inches over portions of the central and eastern Gulf States and 2 to 4 inches farther north into parts of the Tennessee Valley, Ohio Valley and southern Mid Atlantic through Saturday. These rains may lead to flooding concerns across these areas.

A list of preliminary rainfall observations compiled by the NOAA Weather Prediction Center can be found at: www.wpc.ncep.noaa.gov/discussions/nfdsccl.html

STORM SURGE: The combination of a dangerous storm surge and the tide will cause normally dry areas near the coast to be flooded by rising waters moving inland from the shoreline. The water is expected to reach the following heights above ground if the peak surge occurs at the time of high tide...

San Luis Pass to Grand Isle...1 to 2 ft

The deepest water will occur along the immediate coast near the area of onshore winds. Surge-related flooding depends on the relative timing of the surge and the tidal cycle, and can vary greatly over short distances. For information specific to your area, please see products issued by your local National Weather Service forecast office.

WIND: Tropical storm conditions are occurring over portions of the warning area along the coast and are likely to persist through this evening. Gusts to tropical-storm-force are possible over other portions of southern Louisiana through this evening.

SURF: Swells generated by Harvey are still affecting the coast of Louisiana, but are expected to subside late tonight and Thursday. These swells are likely to cause life-threatening surf and rip current conditions. Please consult products from your local weather office.

TORNADOES: A few tornadoes are possible through this evening across parts of Louisiana, Mississippi, western Alabama, and southeast Arkansas. Additional tornadoes are possible on Thursday afternoon and evening across northern portions of Mississippi, Alabama, and Georgia into parts of Tennessee.

NEXT ADVISORY

Next intermediate advisory at 700 PM CDT.

Next complete advisory at 1000 PM CDT.
